EXAMINER

HANNETT, JAMES M

ART UNIT	PAPER NUMBER
----------	--------------

2612

DATE MAILED: 05/04/2005

Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary	Application No. 10/023,951	Applicant(s) OBRADOR ET AL.	
	Examiner James M. Hannett	Art Unit 2612	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 16 February 2005.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-15, 22, 23, and 26-34 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-15, 22, 23, 26, 27, and 29-34 is/are rejected.
- 7) ☒ Claim(s) 28 is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 21 December 2001 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- * See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Continued Examination Under 37 CFR 1.114

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 2/16/2005 has been entered.

Response to Arguments

Applicant's arguments filed 2/16/2005 have been fully considered but they are not persuasive.

In response to applicant's argument that there is no suggestion to combine the references, the examiner recognizes that obviousness can only be established by combining or modifying the teachings of the prior art to produce the claimed invention where there is some teaching, suggestion, or motivation to do so found either in the references themselves or in the knowledge generally available to one of ordinary skill in the art. See *In re Fine*, 837 F.2d 1071, 5 USPQ2d 1596 (Fed. Cir. 1988) and *In re Jones*, 958 F.2d 347, 21 USPQ2d 1941 (Fed. Cir. 1992). In this case, Mottur et al teaches a method of transmitting real-time low-resolution video to remote users. However, Mottur et al does not teach that the users can capture high-resolution stills of the live real time low-resolution video.

Ramasubramanian et al teaches a method for providing a snapshot from a digital video stream. Ramasubramanian et al teaches in the abstract a method of allowing a remote user to select a frame from a low-resolution video stream and have a high resolution image which

Art Unit: 2612

corresponds to the selected video frame sent to them. Ramasubramanian et al further states on Column 2, Lines 33-40 that it is clearly desirable to provide a mechanism that allows a user to obtain a snapshot of a video image, where the snapshot has a size and quality that is superior to the low-resolution video image in order to allow a user to obtain a higher quality image to be sent over a limited bandwidth.

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the video distribution system of Mottur et al to allow a user to select and download a high-resolution still image as taught by Ramasubramanian et al so that a user can obtain a snapshot has a size and quality that is superior to the low-resolution video image.

The applicant argues that the reliance on inherency is misplaced in stating that it is inherent that there are two different communications channels to allow the two processes to take place simultaneously. The applicant further pointed out that multiplexing input signals for communicating upon a single channel are commonly implemented using time division or other multiplexing techniques. The applicant therefore concludes that the existence of alternatives is compelling evidence that the claim limitation is inherent.

The examiner asserts that Mottur et al teaches on Paragraph [0020] providing real-time continuous streaming video and audio data from at least one remote camera system. Furthermore, the system allows the network users to interactively control the cameras using continuous control methods and systems such as panning and tilting. Therefore, in order to have continuous real-time streaming video and continuous controlling of pan and tilt angles it is inherent that there are two different communications channels to allow the two processes to take

Art Unit: 2612

place simultaneously. The claim of communicating using a communications channel different than the channel used to communicate the video and still image is broad. The applicant does not state how the signals are separated, therefore, the examiner views that a single communication line with multiplexed signals separated in the frequency domain or the time domain as constituting a communications line with multiple channels.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

1: Claims 1-15, 22, 23, 26, 27, 29-31, 33, and 34 are rejected under 35 U.S.C. 103(a) as being unpatentable over US 2002/0018124 A1 Mottur et al in view of USPN 6,172,672

Ramasubramanian et al.

2: As for Claim 1, Mottur et al depicts in Figures 1 and 3 and teaches on Paragraph [0020] a method for acquiring a streaming video comprising: Connecting a remote device (48) to one or more photo-video acquisition devices (16) individually comprising a camera, wherein the remote device (48) is controlled by the user; using a connected one of the cameras, generating a video of a scene viewed using the respective camera; Acquiring streamed from the one or more photo-video acquisition devices (16); Mottur et al teaches a video distribution system in which users can control cameras connected via a network. Mottur teaches that the cameras can transmit streaming video, compressed, and uncompressed video; Paragraph [0023]. Mottur et al teaches that video can be sent to the users but does not teach that the users can capture a still frame of the

Art Unit: 2612

video that is being watched and that a high-resolution image of the streaming video can be transmitted upon request.

Ramasubramenian et al teaches on Column 2, Lines 6-10 and on Column 5, Lines 34-44 and in the abstract a method for providing snapshots from a compressed digital video stream over a video distribution system. Ramasubramenian et al teaches that it is advantageous when transmitting video over a limited bandwidth communication medium to enable users with a snapshot feature that allows a user to specify a desired frame of video data and receive a greater resolution image. Ramasubramenian et al teaches that it is advantageous to allow a user to capture a high-resolution still image because it has higher resolution and quality than the low bandwidth streaming video. Ramasubramenian et al teaches that it is preferable to include a snapshot function because often users like to have the ability review a single frame of video.

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to enable the video distribution system of Mottur et al with the snapshot function of Ramasubramenian et al in order to capture a high-resolution still image from the low bandwidth streaming video, since it is preferable to include a snapshot function because often users like to have the ability review a single frame of video.

3: In regards to Claim 2, Mottur et al teaches in Paragraph [0006] the connecting step includes connecting the remote device (48) to the one or more photo-video acquisition devices (16) through a network.

4: As for Claim 3, Mottur et al teaches in Paragraph [0006] the connecting step includes connecting the remote device (48) to the one or more photo-video acquisition devices (16)

Art Unit: 2612

through a point-to-point connection. A point-to-point connection is viewed by the examiner as a internet or a public or private network connection.

5: In regards to Claim 4, Mottur et al teaches on Paragraph [0049] requesting payment information (account information for pay-per-view access) from a user (48) who wishes to control the one or more photo-video acquisition devices (16); and enabling the user to control the one or more photo-video acquisition devices (16) from the remote device (48).

6: As for Claim 5, Mottur et al teaches on Paragraph [0050] further comprising verifying the payment information submitted by the user before enabling the user to control the one or more photo-video acquisition devices. Mottur et al teaches that camera control intervals can be based on subscriber fees.

7: In regards to Claim 6, Mottur et al teaches on Paragraph [0049] the use of a queue system to allow multiple users (48) to control the one or more photo-video acquisition devices (16).

8: As for Claim 7, Mottur et al teaches on Paragraph [0027], Lines 18-21 that the network includes mass storage devices on a network server (18, 20, and 22) to store the videos and the high resolution photographs.

9: In regards to Claim 8, Ramasubramanian et al teaches on Column 2, Lines 6-10 and on Column 5, Lines 34-44 and in the abstract a method for providing snapshots from a compressed digital video stream over a video distribution system. Therefore, Mottur et al in view of Ramasubramanian et al teaches sending the video and high-resolution photograph to the user (48).

10: As for Claim 9, Mottur et al teaches on Paragraph [0005], Lines 6-8 posting the video on a web page. Furthermore, Ramasubramanian et al teaches on Column 2, Lines 6-10 and on

Art Unit: 2612

Column 5, Lines 34-44 and in the abstract a method for providing snapshots from a compressed digital video stream over a video distribution system. Ramasubramenian et al teaches that it is preferable to include a snapshot function because often users like to have the ability review a single frame of video.

11: In regards to Claim 10, Mottur et al teaches on Paragraph [0049] requesting payment information (account information for pay-per-view access) from a user (48) who wishes to download the video and the high-resolution photograph from the web page; and enabling the user (48) to download the video and the high-resolution photograph onto the remote device.

12: As for Claim 11, Mottur et al depicts in Figures 1 and 3 and teaches on Paragraph [0020] a method for acquiring a streaming video comprising: Connecting a remote device (48) to one or more photo-video acquisition devices (16) individually comprising a camera, wherein the remote device (48) is controlled by the user; using a connected one of the cameras, generating a video of a scene viewed using the respective camera; Acquiring streamed from the one or more photo-video acquisition devices (16); Mottur et al teaches a video distribution system in which users can control cameras connected via a network. Mottur teaches that the cameras can transmit streaming video, compressed, and uncompressed video; Paragraph [0023]. Mottur et al teaches that video can be sent to the users but does not teach that the users can capture a still frame of the video that is being watched and that a high-resolution image of the streaming video can be transmitted upon request by a user.

Ramasubramenian et al teaches on Column 2, Lines 6-10 and on Column 5, Lines 34-44 and in the abstract a method for providing snapshots from a compressed digital video stream over a video distribution system. Ramasubramenian et al teaches that it is advantageous when

Art Unit: 2612

transmitting video over a limited bandwidth communication medium to enable users with a snapshot feature that allows a user to specify a desired frame of video data and receive a greater resolution image. Ramasubramanian et al teaches that it is advantageous to allow a user to capture a high-resolution still image because it has higher resolution and quality than the low bandwidth streaming video. Ramasubramanian et al teaches that it is preferable to include a snapshot function because often users like to have the ability review a single frame of video.

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to enable the video distribution system of Mottur et al with the snapshot function of Ramasubramanian et al in order to capture a high-resolution still image from the low bandwidth streaming video, since it is preferable to include a snapshot function because often users like to have the ability review a single frame of video.

13: In regards to Claim 12, Mottur et al teaches in Paragraph [0006] the user (48) can control the one or more photo-video acquisition devices (16) from the remote device (48) through the network or other communication channels.

14: As for Claim 13, Mottur et al teaches on Paragraph [0049] the one or more photo-video acquisition devices (16) include a queue system that allows multiple users (48) to control the one or more photo-video acquisition devices (16).

15: In regards to Claim 14, Mottur et al teaches on Paragraph [0027], Lines 18-21 that the network includes mass storage devices on a network server (18, 20, and 22) to store the videos and the high-resolution photographs.

16: As for Claim 15, Mottur et al teaches on Paragraph [0005], Lines 6-8 posting the video on a web page. Furthermore, Ramasubramanian et al teaches on Column 2, Lines 6-10 and on

Art Unit: 2612

Column 5, Lines 34-44 and in the abstract a method for providing snapshots from a compressed digital video stream over a video distribution system. Ramasubramanian et al teaches that it is preferable to include a snapshot function because often users like to have the ability review a single frame of video.

17: In regards to Claim 22, Mottur et al teaches on Paragraph [0020] communicating a command from the user (48) to the camera (16); and altering an operation of the camera with respect to the generation of the video responsive to the command. The command is viewed by the examiner as the command sent to control the pan, tilt, and zoom settings of the cameras.

18: As for Claim 23, Mottur et al teaches on Paragraph [0020] providing real-time continuous streaming video and audio data from at least one remote camera system. Furthermore, the systems allows the network users to interactively control the cameras using continuous control methods and systems such as panning and tilting. Therefore, in order to have continuous real-time streaming video and continuous controlling of pan and tilt angles it is inherent that there are two different communications channels to allow the two processes to take place simultaneously. Furthermore, Ramasubramanian et al teaches that the system can transmit both high resolution still images and video. This is viewed as the pipeline configured to transmit both still and motion images. Furthermore, the examiner views the limitation of “using a communications channel that is different” as being broad and does not specify that the two channels are on different physical lines, center frequencies, of time slots.

19: In regards to Claim 26, Mottur et al depicts in Figures 1 and 3 and teaches on Paragraph [0020] a method for acquiring a streaming video comprising: Connecting a remote device (48) to one or more photo-video acquisition devices (16) individually comprising a camera, wherein the

Art Unit: 2612

remote device (48) is controlled by the user; using a connected one of the cameras, generating a video of a scene viewed using the respective camera; Acquiring streamed from the one or more photo-video acquisition devices (16); Mottur et al teaches a video distribution system in which users can control cameras connected via a network. Mottur teaches that the cameras can transmit streaming video, compressed, and uncompressed video; Paragraph [0023]. Mottur et al teaches on Paragraph [0020] communicating a command from the user (48) to the camera (16); and altering an operation of the camera with respect to the generation of the video responsive to the command. The command is viewed by the examiner as the command sent to control the pan, tilt, and zoom settings of the cameras. Mottur et al teaches that video can be sent to the users but does not teach that the users can capture a still frame of the video that is being watched and that a high-resolution image of the streaming video can be transmitted upon request by a user.

Ramasubramenian et al teaches on Column 2, Lines 6-10 and on Column 5, Lines 34-44 and in the abstract a method for providing snapshots from a compressed digital video stream over a video distribution system. Ramasubramenian et al teaches that it is advantageous when transmitting video over a limited bandwidth communication medium to enable users with a snapshot feature that allows a user to specify a desired frame of video data and receive a greater resolution image. Ramasubramenian et al teaches that it is advantageous to allow a user to capture a high-resolution still image because it has higher resolution and quality than the low bandwidth streaming video. Ramasubramenian et al teaches that it is preferable to include a snapshot function because often users like to have the ability review a single frame of video.

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to enable the video distribution system of Mottur et al with the snapshot

Art Unit: 2612

function of Ramasubramenian et al in order to capture a high-resolution still image from the low bandwidth streaming video, since it is preferable to include a snapshot function because often users like to have the ability review a single frame of video.

20: As for Claim 27, Furthermore, Motter et al teaches on Paragraph [0020] that the video provided to the remote user is real-time streaming video. Therefore, the video is not stored before it is transmitted to the user and would be stored for a first time after the image is generated and transmitted to a user.

21: In regards to Claim 29, Mottur et al teaches on Paragraph [0027], Lines 18-21 that the network includes mass storage devices on a web presentation network server (18, 20, and 22) to store the videos. Mottur et al teaches on Paragraph [0005], Lines 6-8 posting the video on a web page. Therefore, Mottur et al teaches a server coupled with the network and configured to host a web page, wherein the server is configured to post the videos using data acquired by one or more photo-video acquisition devices (cameras). Furthermore, Mottur et al teaches on Paragraph [0027 and 0005] downloading the videos to remote devices responsive to a command received from the remote devices. The remote devices are viewed as the remote users.

22: As for Claim 30, Mottur et al depicts in Figures 1 and 3 and teaches on Paragraph [0020] a method for acquiring a streaming video comprising: Connecting a remote device (48) to one or more photo-video acquisition devices (16) individually comprising a camera, wherein the remote device (48) is controlled by the user; using a connected one of the cameras, generating a video of a scene viewed using the respective camera; Acquiring streamed from the one or more photo-video acquisition devices (16); Mottur et al teaches a video distribution system in which users can control cameras connected via a network. Mottur teaches that the cameras can transmit

Art Unit: 2612

streaming video, compressed, and uncompressed video; Paragraph [0023]. Mottur et al teaches that video can be sent to the users but does not teach that the users can capture a still frame of the video that is being watched and that a high-resolution image of the streaming video can be transmitted upon request by a user using a joint video and still image pipeline.

Ramasubramanian et al teaches on Column 2, Lines 6-10 and on Column 5, Lines 34-44 and in the abstract a method for providing snapshots from a compressed digital video stream over a video distribution system. Ramasubramanian et al teaches that it is advantageous when transmitting video over a limited bandwidth communication medium to enable users with a snapshot feature that allows a user to specify a desired frame of video data and receive a greater resolution image. Ramasubramanian et al teaches that it is advantageous to allow a user to capture a high-resolution still image because it has higher resolution and quality than the low bandwidth streaming video. Ramasubramanian et al teaches that it is preferable to include a snapshot function because often users like to have the ability review a single frame of video.

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to enable the video distribution system of Mottur et al with the snapshot function of Ramasubramanian et al in order to capture a high-resolution still image from the low bandwidth streaming video, since it is preferable to include a snapshot function because often users like to have the ability review a single frame of video.

23: In regards to Claim 31, Mottur et al teaches in Paragraph [0006] the user (48) can control the one or more photo-video acquisition devices (16) from the remote device (48) through the network or other communication channels. Mottur et al teaches on Paragraph [0049] requesting payment information (account information for pay-per-view access) from a user (48) who wishes

Art Unit: 2612

to control the one or more photo-video acquisition devices (16); and enabling the user to control the one or more photo-video acquisition devices (16) from the remote device (48).

Ramasubramenian et al teaches on Column 2, Lines 6-10 and on Column 5, Lines 34-44 and in the abstract a method for providing snapshots from a compressed digital video stream over a video distribution system. Therefore, Mottur et al in view of Ramasubramenian et al teaches sending the video and high-resolution photograph to the user (48).

24: In regards to Claim 33, Mottur et al teaches the use of sending video to remote users (48) on a network. However, Mottur et al does not teach that the users can be located in their homes.

Official notice is taken that it was well known in the art at the time the invention was made to use personal computers at home in order to give convenience to a user.

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to allow the users (48) in the video distribution system of Mottur et al to be located in the users homes, in order to give convenience to the user.

25: As for Claim 34, Mottur et al depicts in Figures 1 and 3 and teaches on Paragraph [0020] an image data communication method comprising: providing a remotely located camera (16); capturing live video data of a scene using the camera (streaming video); coupling a remote device (48) with the camera (16) using a network; communicating captured live video data from the camera (16) to the remote device using the network, wherein the captured live video data has a first resolution; The first resolution is the streaming video resolution. outputting a first command from the remote device (48); the first command is viewed as the command sent by a user to control the pan and tilt of the camera (16). Therefore, altering the capturing of the live video data of the scene using the camera responsive to the first command;

Art Unit: 2612

Mottur et al teaches that video can be sent to the users but does not teach that the users can capture a still frame (second command) of the video that is being watched and that a high-resolution image of the streaming video can be transmitted upon request by a user using a joint video and still image pipeline.

Ramasubramanian et al teaches on Column 2, Lines 6-10 and on Column 5, Lines 34-44 and in the abstract a method for providing snapshots from a compressed digital video stream over a video distribution system. Ramasubramanian et al teaches that it is advantageous when transmitting video over a limited bandwidth communication medium to enable users with a snapshot feature that allows a user to specify a desired frame of video data and receive a greater resolution image. Ramasubramanian et al teaches that it is advantageous to allow a user to capture a high-resolution still image because it has higher resolution and quality than the low bandwidth streaming video. Ramasubramanian et al teaches that it is preferable to include a snapshot function because often users like to have the ability review a single frame of video.

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to enable the video distribution system of Mottur et al with the snapshot function of Ramasubramanian et al in order to capture a high-resolution still image from the low bandwidth streaming video, since it is preferable to include a snapshot function because often users like to have the ability review a single frame of video.

26: Claim 32 is rejected under 35 U.S.C. 103(a) as being unpatentable over US

2002/0018124 A1 Mottur et al in view of USPN 6,172,672 Ramasubramanian et al in view of USPN 6,591,068 Dietz.

Art Unit: 2612

27: As for Claim 32, Mottur et al in view of Ramasubramanian et al teaches the use of capturing a high-resolution image from streaming video and sending the image on the network to remote users (48). Mottur et al in view of Ramasubramanian et al does not teach storing the high-resolution photograph in a local storage; and printing the high resolution photograph on a printer at home.

Dietz teaches on Column 6, Lines 34-60 the use of a system in which several cameras are connected to a network in which a user at a computer terminal can select images to be printed which were sent to the computer over a network. Dietz teaches that it is advantageous to allow users to print the images on a printer because it allows them to have a hard copy photograph of an event they want to remember.

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to enable the user on the system of Mottur et al in view of Ramasubramanian et al to print a selected image on a printer in order to allows them to have a hard copy photograph of an event they want to remember.

Allowable Subject Matter

28: Claim 28 is objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. US 2004/0001214 Monroe teaches a video distribution system that can transmit both video and still images.
